

ADD-ON MODULES

Extensis Portfolio 2016 is a modular digital asset management system that allows you to select the functionality you need when you need it.

Portfolio NetPublish

Quick and Easy File Distribution via the Web

When select assets need to be shared outside your organization or distributed among a large group, Portfolio NetPublish allows branded web portals to be easily created. You don't need to know HTML, CSS, or any other web technology for that matter. Simply select the assets you need to distribute and instantly create a secure online portal with a single click. Assets can be dynamically updated, ensuring everyone has the most recent files when they need them.

Portfolio Media Engine

Convert Digital Files on the Fly

Portfolio Media Engine helps your users convert files to the formats and sizes they need. No more waiting around for long processing jobs to finish. The Portfolio Media Engine automates this process, resulting in users always having the right file in the right format and right size.

Portfolio Smart Keywords

Comparative Image Recognition for Automated Keywording

Portfolio Smart Keywords dramatically reduces manual time assigning keywords, the underpinning for effective digital asset management. With two simple clicks, Smart Keywords uses an Artificial Intelligence algorithm to compare thumbnails against billions of images. These well-trained algorithms interpret the images and instantly deliver a list of suggested keywords to help your users find the assets they are searching for.

Portfolio API

Integrate Business Systems

The Portfolio API enables your development team to quickly create custom integrations between Portfolio and your other business systems. By sharing information between systems, you'll eliminate unnecessary duplication of work and effort.
